Health and economic impacts of lead exposure
Outline

- Background
- Health effects
- Vulnerable groups
- Societal and economic impacts
WHO 10 chemicals of major public health concern

- Pesticides
- Air Pollution
- Mercury
- Arsenic
- Asbestos
- Lead
- Fluoride
- Cadmium
- Dioxin
- Benzene
Background

• Lead is a versatile and widely used toxic substance

• Human activities result in environmental contamination:
  ➢ mining & smelting; manufacturing, use, recycling and disposal of products made with lead

• Can be used in the manufacture of paint to give properties e.g. colour, rapid drying, corrosion resistance

• Lead paint is a source of human exposure to lead
Lead persists in the environment

• Lead can be released during paint manufacture, application and removal

• Old lead paint fragments into flakes and dust that contaminate the environment

• Lead can remain in the environment indefinitely

• Lead paint creates legacy of potential human exposure for years into the future
Lead is a multi-system toxicant

- Inhalation and ingestion are main routes of exposure
- No known level of exposure without harmful effects
- Accumulates in bone
- Affects multiple body systems
- Long-term effects include reduced IQ, cardiovascular & renal disease
Children are especially vulnerable

• Greater exposure:
  ➢ spend more time on the ground and in contact with contaminated soil and dust
  ➢ hand-to-mouth activity, mouthing
  ➢ absorb 4–5 times more lead from the gut than adults

• Early childhood is critical period for neurological and organ development

• Damage may be permanent
  ➢ reduced potential for intellectual development
  ➢ increased likelihood of behavioural disorders
Pregnant women are vulnerable

- Pregnancy mobilizes lead stored in bone, releasing it back into blood where it can be circulated to maternal tissues and the fetus
- Increased risk of hypertension during pregnancy
- Lead exposure of pregnant women results in exposure of the fetus – may cause reduced fetal growth
Lead causes significant burden of disease

*Estimates from Institute for Health Metrics and Evaluation (IHME), 2017 data*

- 1.06 million deaths from long-term effects
- 24.4 million years of healthy life lost (DALYs)
- 63.2% of the global burden of idiopathic developmental intellectual disability
- 10.3% of hypertensive disease

Small IQ reduction has significant societal impact

Distribution of IQ Scores in US Children

- Mean IQ = 100
- 6 Million
- Challenged
- Most of us
- Gifted

Distribution of IQ Scores in Lead-Exposed US Children

- Mean IQ = 95
- 9.4 Million
- 2.4 Million
Economic costs of lead exposure are high

• Estimated economic losses due to reduced IQ is ~1.2% of global GDP
  ➢ 1% of Jordanian GDP

• Banning lead paint now saves future costs
  ➢ Avoids future costs of lead exposure when lead paint used now e.g. cost of reduced IQ, cost of criminality
  ➢ Avoids future costs of hazard controls for legacy paint e.g. remediation
    o estimated costs of remediating lead-painted homes:
      France: US$ 194 – 499 million
      USA: US$ 1 – 11 billion
Conclusions

• Lead is a persistent hazard – it remains in the environment, in the home and in the human body

• Lead has wide-ranging effects on health – these have personal, societal and economic impacts

• Lead paint is an important source of exposure to lead

• Prevention through banning lead paint is better (and cheaper) than cure!
