

Inputs from the **United Kingdom** are as follows:

The model for the post 2020 framework should be simple and understandable such as the approach used for the Strategic plan for Biodiversity. A limited number of high-level objectives should be considered and could include:

1. Prevent or minimise adverse effects/impacts of chemicals during production, in use and when waste on the environment and human health at national, regional and global levels;
2. Improve the awareness and knowledge of hazardous properties of chemicals and chemicals in products;
3. Maximise the benefits through sustainable production and use of chemicals;
4. Substances of global concern have been phased out or effectively restricted; and
5. Enhance implementation through planning, knowledge management and capacity building.

In addition, examples of objectives that could be delivered through the MEAs include:

1. By 2028 make sure that all PCB uses are ceased through completing national inventories of all PCBs, increase awareness and knowledge of PCB equipment owners to avoid contamination and establish proper storage and disposal and the environmental sound management of PCB waste; and
2. By 2030 reduce land-based emissions of mercury to air and water by 50%.
